Spatial Analysis and Modeling (GIST 4302/5302)

Guofeng Cao
Department of Geosciences
Texas Tech University

Outline of This Week

- Last week, we learned:
 - spatial point pattern analysis (PPA)
 - focus on location distribution of 'events'
 - Measure the cluster (spatial autocorrelation)in point pattern
- This week, we will learn:
 - How to measure and detect clusters/spatial autocorrelation in areal data (regional data)

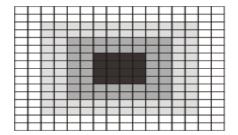

Spatial Autocorrelation

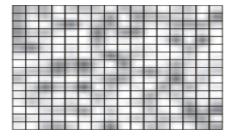

- Spatial autocorrelationship is everywhere
 - Spatial point pattern
 - K, G functions
 - Kernel functions
 - Areal/lattice (this topic)
 - Geostatistical data (next topic)

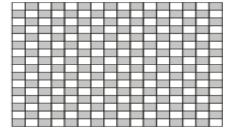

Spatial Autocorrelation of Areal Data

Spatial Autocorrelation

- Tobler's first law of geography
- Spatial auto/cross correlation

If like values tend to cluster together, then the field exhibits high positive spatial autocorrelation

If there is no apparent relationship between attribute value and location then there is zero spatial autocorrelation

If like values tend to be located away from each other, then there is negative spatial autocorrelation

Positive spatial autocorrelation

- high values
 surrounded by nearby high values
- intermediate values surrounded by nearby intermediate values
- low values surrounded by nearby low values

≩

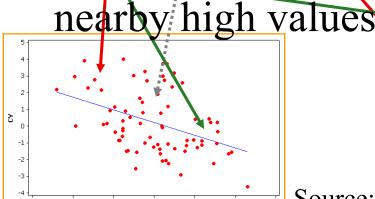

Source: Ron Briggs of UT Dallas

2002 population

density

Negative spatial autocorrelation

- high values surrounded by nearby low values
- intermediate values surrounded by nearby intermediate values
- low values surrounded by

competition for space

Grocery store density

Measuring Spatial Autocorrelation: the problem of measuring "nearness"

To measure spatial autocorrelation, we must know the "nearness" of our observations as we did for point pattern case

• Which points or polygons are "near" or "next to" other points or polygons?

-Which states are near Teras?

-How to measure this?

Seems simple and obvious,

but it is not!

Spatial Weight Matrix

- Core concept in statistical analysis of areal data
- Two steps involved:
 - define which relationships between observations are to be given a nonzero weight, i.e., define spatial neighbors
 - assign weights to the neighbors

Spatial Neighbors

Contiguity-based neighbors

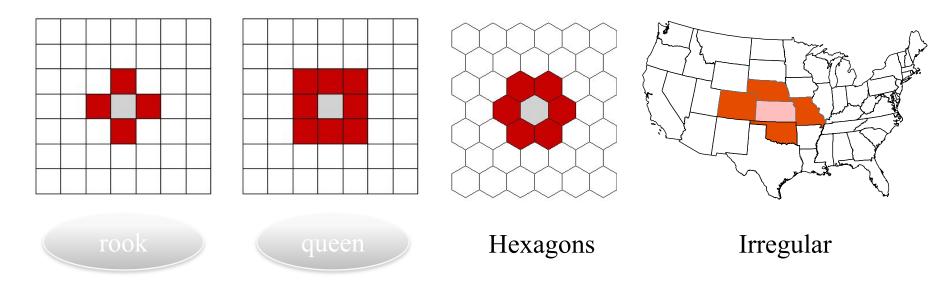

- Zone i and j are neighbors if zone i is contiguity or adjacent to zone j
- But what constitutes contiguity?

Distance-based neighbors

- Zone i and j are neighbors if the distance between them are less than the threshold distance
- But what distance do we use?

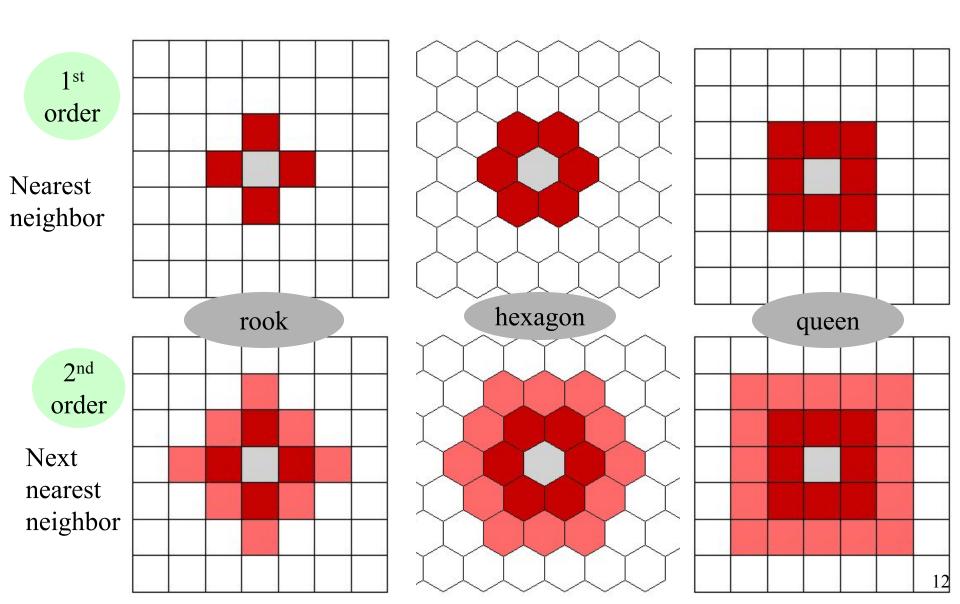

Contiguity-based Spatial Neighbors

- Sharing a border or boundary
 - Rook: sharing a border
 - Queen: sharing a border <u>or</u> a point

Which use?

Higher-Order Contiguity

Distance-based Neighbors

- How to measure distance between polygons?
- Distance metrics
 - 2D Cartesian distance (projected data)
 - 3D spherical distance/great-circle distance (lat/long data)
 - Haversine formula

```
Haversine a = \sin^2(\Delta \phi/2) + \cos(\phi_1).\cos(\phi_2).\sin^2(\Delta \lambda/2)
formula: c = 2.a \tan 2(\sqrt{a}, \sqrt{(1-a)})
d = R.c
```

Distance-based Neighbors

• k-nearest neighbors

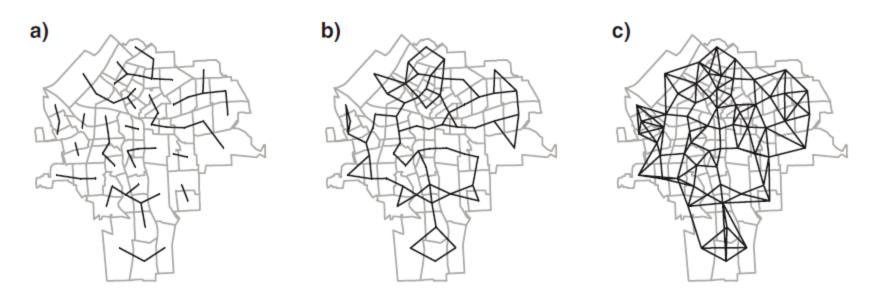

Fig. 9.5. (a) k = 1 neighbours; (b) k = 2 neighbours; (c) k = 4 neighbours

Source: Bivand and Pebesma and Gomez-Rubio

Distance-based Neighbors

• thresh-hold distance (buffer)

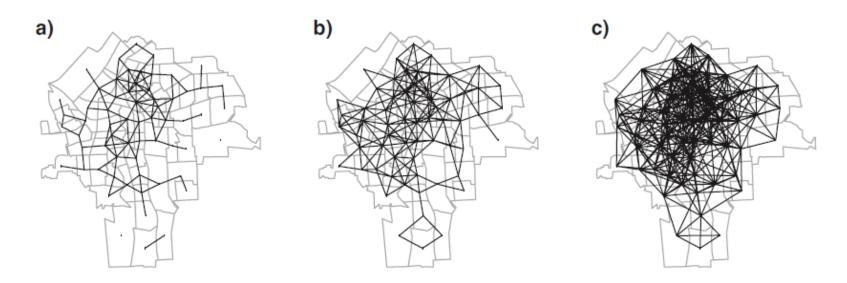

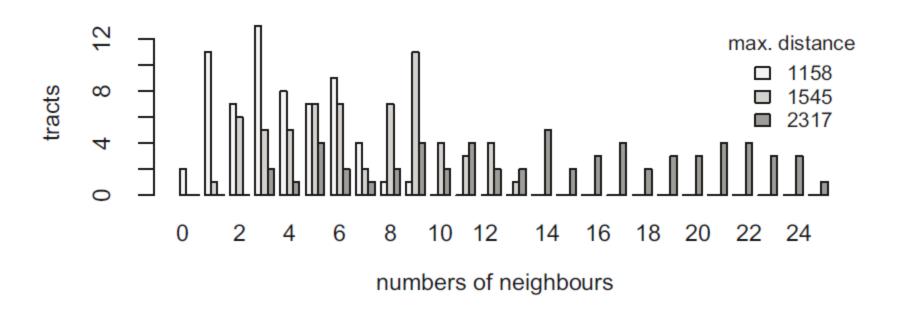

Fig. 9.6. (a) Neighbours within 1,158 m; (b) neighbours within 1,545 m; (c) neighbours within 2,317 m

Source: Bivand and Pebesma and Gomez-Rubio

Neighbor/Connectivity Histogram

Source: Bivand and Pebesma and Gomez-Rubio

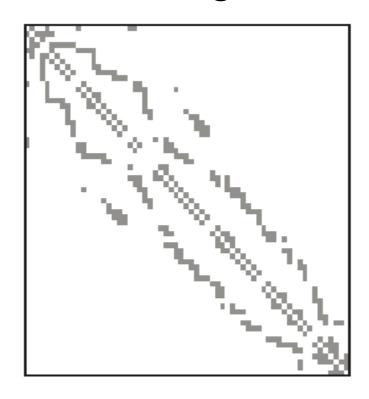

Spatial Weight Matrix

• Spatial weights can be seen as a list of weights indexed by a list of neighbors

• If zone j is not a neighbor of zone i, weights

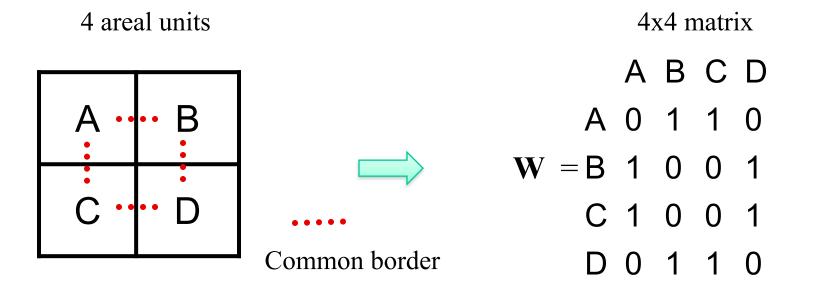

Wij will set to zero

- The weight matrix can be illustrated as an image
- Sparse matrix

A Simple Example for Rook case

- Matrix contains a:
 - 1 if share a border
 - 0 if do not share a border

Style of Spatial Weight Matrix

- Row
 - a weight of unity for each neighbor relationship
- Row standardization
 - Symmetry not guaranteed
 - can be interpreted as allowing the calculation of average values across neighbors
- General spatial weights based on distances

Row vs. Row standardization

Divide each number by the **row sum**

Total number of neighbors
--some have more than others

							Row
	Α	В	С	D	E	F	Sum
Α	0	1	0	1	0	0	2
В	1	0	1	0	1	0	3
С	0	1	0	0	0	1	2
D	1	0	0	0	1	0	2
Ε	0	1	0	1	0	1	3
F	0	0	1	0	1	0	2

Row standardized --usually use this

	А	В	С	D	E	F	Row Sum
Α	0.0	0.5	0.0	0.5	0.0	0.0	1
В	0.3	0.0	0.3	0.0	0.3	0.0	1
С	0.0	0.5	0.0	0.0	0.0	0.5	1
D	0.5	0.0	0.0	0.0	0.5	0.0	1
E	0.0	0.3	0.0	0.3	0.0	0.3	1
F	0.0	0.0	0.5	0.0	0.5	0.0	1

General Spatial Weights Based on Distance

- Decay functions of distance
 - Most common choice is the inverse (reciprocal) of the distance between locations i and j $(w_{ij} = 1/d_{ij})$
 - Other functions also used
 - inverse of squared distance $(w_{ij} = 1/d_{ij}^2)$, or
 - negative exponential $(w_{ij} = e^{-d} \ or \ w_{ij} = e^{-d^2})$

Measure of Spatial Autocorrelation

Global Measures and Local Measures

Global Measures

- A single value which applies to the entire data set
 - The same pattern or process occurs over the entire geographic area
 - An average for the entire area

Local Measures

- A value calculated for <u>each</u> observation unit
 - Different patterns or processes may occur in different parts of the region
 - A unique number for each location
- Global measures usually can be decomposed into a combination of local measures

Global Measures and Local Measures

- Global Measures
 - Moran's I
- Local Measures
 - Local Moran's I

Moran's I

- The most common measure of Spatial Autocorrelation
- Use for points or polygons

Patrick Alfred Pierce Moran (1917-1988)

Formula for Moran's I

$$I = \frac{N \sum_{i=1}^{n} \sum_{j=1}^{n} w_{ij} (x_i - \overline{x})(x_j - \overline{x})}{(\sum_{i=1}^{n} \sum_{j=1}^{n} w_{ij}) \sum_{i=1}^{n} (x_i - \overline{x})^2}$$

Where:

 $\frac{N}{\overline{X}}$ is the number of observations (points or polygons) is the mean of the variable X_i is the variable value at a particular location X_j is the variable value at another location W_{ij} is a weight indexing location of i relative to j

28

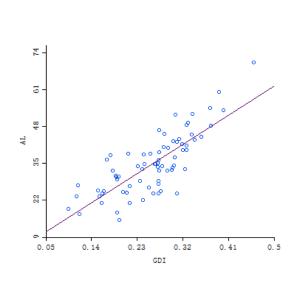

Moran's I and Correlation Coefficient

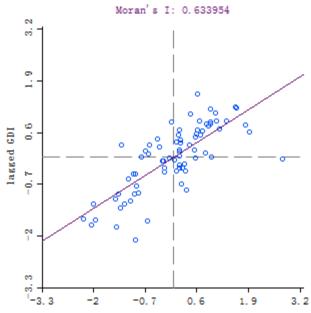

Correlation Coefficient [-1, 1]

Relationship between <u>two</u> different variables

Moran's I [-1, 1]

- Spatial autocorrelation and often involves <u>one</u> (spatially indexed) variable only
- Correlation between observations of a spatial variable at location X and "spatial lag" of X formed by averaging all the observation at neighbors of X

$$\frac{\sum_{i=1}^{n} 1(y_i - \overline{y})(x_i - \overline{x})/n}{\sqrt{\sum_{i=1}^{n} (y_i - \overline{y})^2} \sqrt{\sum_{i=1}^{n} (x_i - \overline{x})^2}}$$

Correlation Coefficient

Note the similarity of the numerator (top) to the measures of spatial association discussed earlier if we view Yi as being the Xi for the neighboring polygon

(see next slide)

$$\frac{N\sum_{i=1}^{n}\sum_{j=1}^{n}w_{ij}(x_{i}-\overline{x})(x_{j}-\overline{x})}{(\sum_{i=1}^{n}\sum_{j=1}^{n}w_{ij})\sum_{i=1}^{n}(x_{i}-\overline{x})^{2}}$$

Spatial auto-correlation

$$\frac{\sum_{i=1}^{n} \sum_{j=1}^{n} w_{ij}(x_{i} - \overline{x})(x_{j} - \overline{x}) / \sum_{i=1}^{n} \sum_{j=1}^{n} w_{ij}}{\sqrt{\sum_{i=1}^{n} (x_{i} - \overline{x})^{2} \sqrt{\sum_{i=1}^{n} (x_{i} - \overline{x})^{2}}} \sqrt{\sum_{i=1}^{n} (x_{i} - \overline{x})^{2}}$$

Source: Ron Briggs of UT Dallas

$$\frac{\displaystyle\sum_{i=1}^{n}1(y_{i}-\overline{y})(x_{i}-\overline{x})/n}{\sqrt{\displaystyle\sum_{i=1}^{n}(y_{i}-\overline{y})^{2}}\sqrt{\displaystyle\sum_{i=1}^{n}(x_{i}-\overline{x})^{2}}}$$

Correlation Coefficient

Spatial weights

Yi is the Xi for the neighboring polygon

$$\frac{N \sum_{i=1}^{n} \sum_{j=1}^{n} W_{ij} (X_{i} - \overline{X}) (X_{j} - \overline{X})}{(\sum_{i=1}^{n} \sum_{j=1}^{n} W_{ij}) \sum_{i=1}^{n} (X_{i} - \overline{X})^{2}}$$

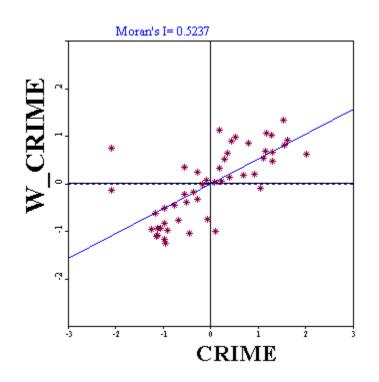

Moran's I

$$\frac{\sum_{i=1}^{n} \sum_{j=1}^{n} w_{ij} (x_{i} - \overline{x})(x_{j} - \overline{x}) / \sum_{i=1}^{n} \sum_{j=1}^{n} w_{ij}}{\sum_{i=1}^{n} (x_{i} - \overline{x})^{2}} \sqrt{\sum_{i=1}^{n} (x_{i} - \overline{x})^{2}} \sqrt{\sum_{i=1}^{n$$

Source: Ron Briggs of UT Dallas

Moran Scatter Plots

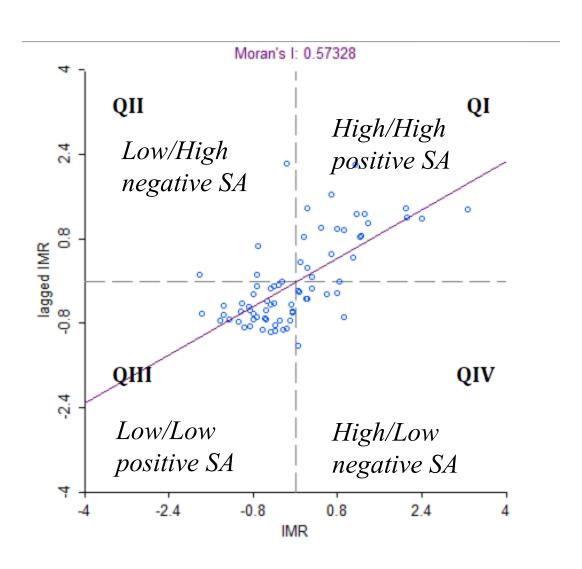

We can draw a scatter diagram between these two variables (in standardized form): **X** and **lag-X** (or W_X)

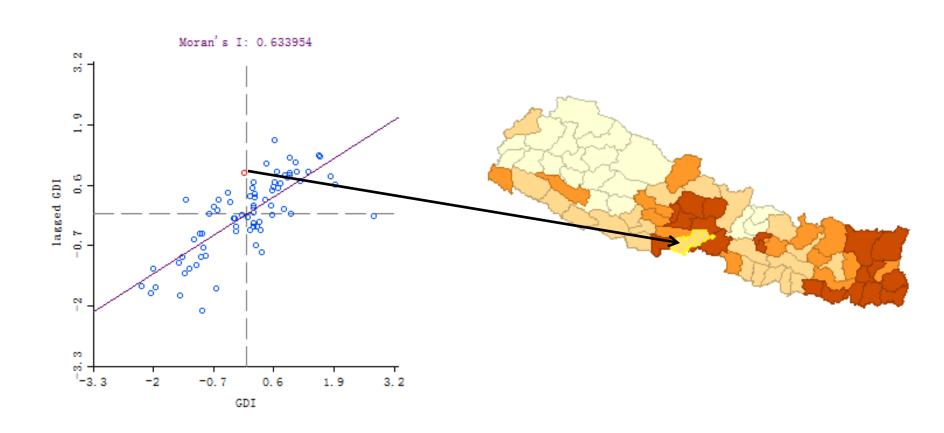

The <u>slope</u> of this *regression line* is Moran's I

Moran Scatter Plots

Moran Scatterplot: Example

Statistical Significance Tests for Moran's I

Based on the normal frequency distribution with

$$Z = \frac{I - E(I)}{S_{error(I)}}$$

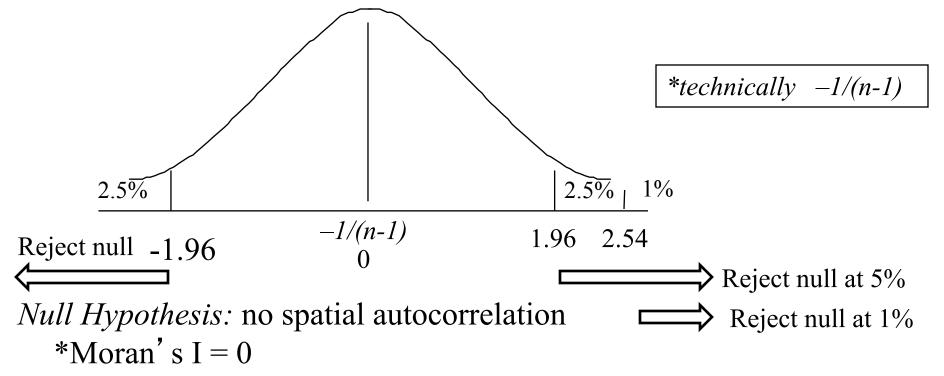

Where: I is the calculated value for Moran's I from the sample

E(I) is the expected value if random

S is the standard error

- Statistical significance test
 - Monte Carlo test, as we did for spatial pattern analysis
 - Permutation test
 - Non-parametric
 - Data-driven, no assumption of the data
 - Implemented in GeoDa

Test Statistic for Normal Frequency Distribution

Alternative Hypothesis: spatial autocorrelation exists

*Moran's I > 0

Reject Null Hypothesis if Z test statistic > 1.96 (or < -1.96)

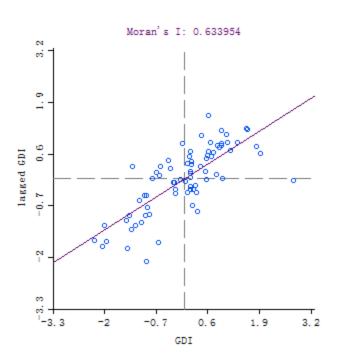

- ---less than a 5% chance that, in the population, there is no spatial autocorrelation
- ---95% confident that spatial auto correlation exits

- Null Hypothesis: no spatial autocorrelation *Moran's I = 0
- *Alternative Hypothesis:* spatial autocorrelation exists *Moran's I > 0
- Reject Null Hypothesis if Z test statistic > 1.96 (or < -1.96)
 - ---less than a 5% chance that, in the population, there is no spatial autocorrelation
 - ---95% confident that spatial auto correlation exits

Spatial Autocorrelation vs Correlation

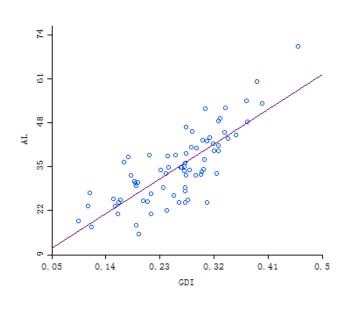

Spatial Autocorrelation:

shows the association or relationship between the same variable in "nearby" areas.

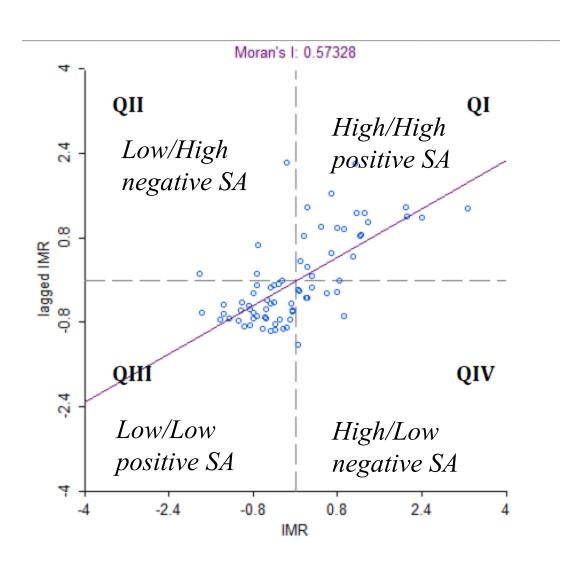

Standard Correlation

shows the association or relationship between two different variables

Bivariate Moran Scatter Plot

Local Measures of Spatial Autocorrelation

Local Indicators of Spatial Association (LISA)

- Local versions of Moran's I, and the Getis-Ord G statistic
- Moran's I is most commonly used, and the local version is often called Anselin's LISA, or just LISA

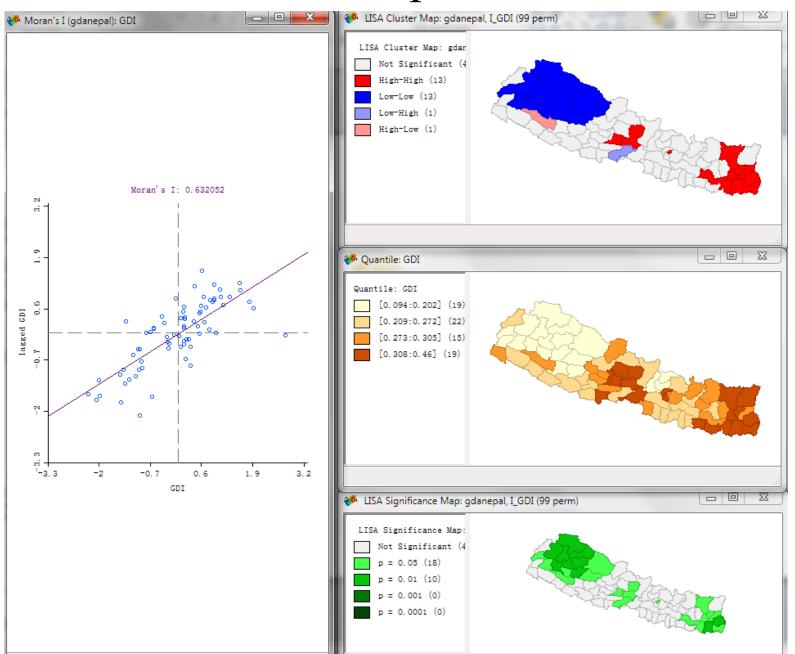

See:

Luc Anselin 1995 Local Indicators of Spatial Association-LISA Geographical Analysis 27: 93-115

Local Indicators of Spatial Association (LISA)

- The statistic is calculated for **each** areal unit in the data
- For each polygon, the index is calculated <u>based on neighboring</u> <u>polygons with which it shares a border</u>
- A measure is available for <u>each</u> polygon, these can be mapped to indicate how <u>spatial autocorrelation varies</u> over the study region
- Each index has an associated test statistic, we can also map which of the polygons has a <u>statistically significant relationship</u> with its neighbors, and show <u>type</u> of relationship

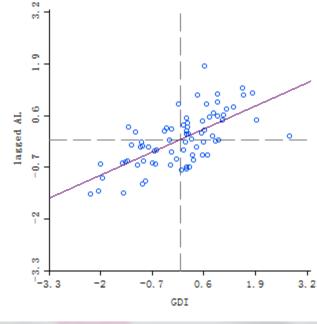

Example:

Bivariate LISA

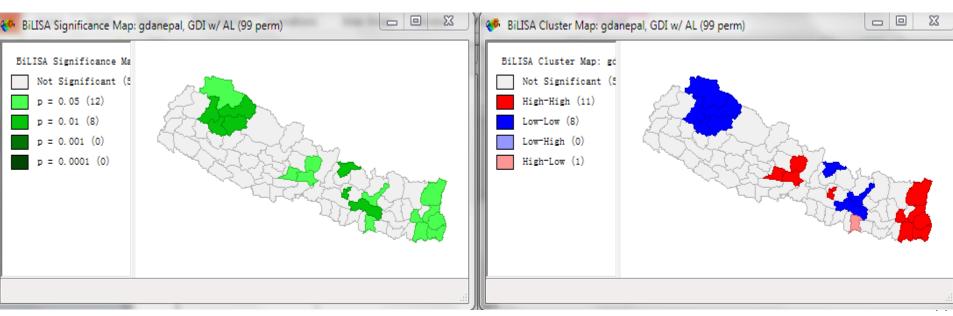

- Moran's I is the correlation between X and Lag-X--the <u>same</u> variable but in <u>nearby</u> areas
 - Univariate Moran's I
- Bivariate Moran's I is a correlation between X and a <u>different</u> variable in <u>nearby</u> areas.

Moran Significance Map for GDI vs. AL

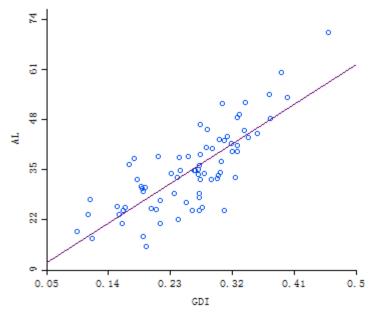

Moran Scatter Plot for GDI vs AL

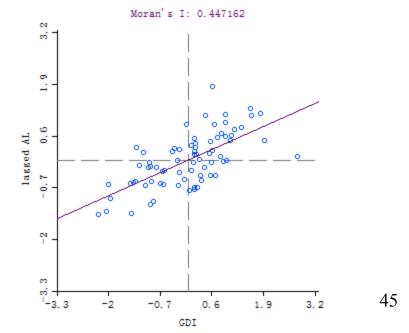

Moran's I: 0.447162

Bivariate LISA and the Correlation Coefficie

- Correlation Coefficient is the relationship between two <u>different</u> variables in the <u>same</u> area
- Bivariate LISA is a correlation between two <u>different</u> variables in an area and in <u>nearby</u> areas.

Consequences of Ignoring Spatial Autocorrelation

- correlation coefficients and coefficients of determination appear <u>bigger</u> than they really are
 - •You think the relationship is stronger than it really is
 - •the variables in nearby areas affect each other
- Standard errors appear <u>smaller</u> than they really are
 - •exaggerated precision
 - •You think your predictions are better than they really are since standard errors measure *predictive accuracy*
 - •More likely to conclude relationship is *statistically significant*.

Diagnostic of Spatial Dependence

For correlation

- calculate Moran's I for each variable and test its statistical significance
- If Moran's I is significant, you may have a problem!

For regression

- calculate the residualsmap the residuals: do you see any spatial patterns?
- Calculate Moran's I for the residuals: is it statistically significant?

Summary

- Spatial autocorrelation of areal data
- Spatial weight matrix
- Measures of spatial autocorrelation
- Global Measure
 - Moran's I
- Consequences of ignoring spatial autocorrelation
- Significance test
